Court IQ

Court-IQ uses AI and machine learning to analyze player performance, trends, and matchup data.

The system processes real NBA statistics to generate predictions and insights that help evaluate player outcomes.

The application was developed in VS Code using Python, integrating real NBA data and machine learning models. It was then pushed to GitHub for version control and deployed on Streamlit for live access.

COURT-IQ

NBA PLAYER PREDICTIONS

COURT-IQ SYSTEM ARCHITECTURE

End-to-end pipeline from data collection to real-time NBA player predictions

AUTOMATION (GitHub Actions)

`.github/workflows/update_nba_data.yml`

- ✓ Runs daily (scheduled)
- ✓ Automates data updates
- ✓ Ensures fresh and up-to-date predictions

Court-IQ

combines automated data collection, machine learning, and an interactive UI to deliver real-time NBA player predictions.

COURT-IQ TESTING & VALIDATION

Ensuring accuracy, reliability, and performance of NBA player predictions

“The system was tested using real player data and achieved significant prediction accuracy, demonstrating reliable performance.

- Predictions closely matched recent player performance trends
- Model produced consistent outputs across multiple tests
- Higher accuracy when using recent game data
- Application successfully generated results in real time
- System demonstrated reliable performance for MVP level

Results during testing ...

These examples were generated during the testing and improvement stages of the application and represent real outputs from the system. Many predictions were accurate, while some showed variance, which is expected when working with real-world sports data. Overall, the system demonstrates strong consistency and practical application.

Streamlit

FAST DEVELOPMENT

Build and iterate on apps quickly.

INTERACTIVE UI

Create intuitive and interactive web interfaces.

EASY DEPLOYMENT

Deploy web apps effortlessly and share with anyone.

STREAM LIT

Streamlit was used to build and deploy the user interface for Court-IQ. It connects the backend machine learning logic with an interactive frontend, allowing users to view real-time NBA player predictions through a web-based application.
